return (h**2*K**2)/(2*m)

give_energy = np.vectorize(give_energy)

In [1]: import numpy as np import matplotlib.pyplot as plt from sympy import *

Imports

Defining a Function to get the energy corresponding to a given K.

def give_energy(K, h=1, m=1): This function calculates the energy of a particle in a potential

In [2]:

Solution **Defining the Matrix**

<u>Assignment 1</u>

 $M = \left[egin{array}{cccc} rac{n}{2m} - E & V_{rac{-2\pi}{a}} & V_{rac{2\pi}{a}} \ V_{rac{2\pi}{a}} & rac{\hbar^2(K+rac{2\pi}{a})^2}{2m} - E & V_{rac{4\pi}{a}} \ V_{rac{-2\pi}{a}} & V_{rac{-4\pi}{a}} & rac{\hbar^2(K-rac{2\pi}{a})^2}{2m} - E \end{array}
ight]$ We need to diagonalize this. This can either be down by setting the determinant of E to zero: det(M) = 0

Setting the determinant to zero will give us a third order eqaution in E, solving which gives three distinct

E = Symbol('E')

Ep = Symbol('Ep') Em = Symbol('Em')

Here for simplicity, We have used:

The final matrix, that we get is:

roots which are the required energies. Or alternatively, the same can also be done by finding the eigenvalues of the matrix M. But we'll use the first method. #Setting the variables In [3]:

Vp = Symbol('V', complex=True) Vm = Vp.conjugate() Vpp = Symbol('Vp', complex=True)

Vmm = Vpp.conjugate() E0 = Symbol('E0')

In [4]: #Creating the matrix mat = Matrix([[E0-E, Vm, Vp], [Vm, Ep-E, Vpp], [Vp, Vmm, Em-E]])

Out[4]: $\left\lceil -E + E_0 \right\rceil$

 $E_0=rac{\hbar^2 K^2}{2a^2}$ $E_p=rac{\hbar^2(K+rac{2\pi}{a})^2}{2a^2}$

 $E_m=rac{\hbar^2(K-rac{2\pi}{a})^2}{2a^2}$

 $V=V_{rac{-2\pi}{2}}$

 $ar{V}=V_{rac{2\pi}{a}}$

 $V_p = V_{rac{4\pi}{a}}$ $ar{V}_p = V_{rac{-4\pi}{a}}$

If we solve the equation symbolically for E, we'll get a HUGE expression for E. To make the expression

Out[5]: $-E^3 + E^2E_0 + E^2Em + E^2Ep - EE_0Em - EE_0Ep - EEmEp + 3E + E_0EmEp - E_0 - Em$

 $\#Substituting\ Vp\ =\ Vpp\ =1$ to simplify the equation

smaller, we'll set the values of V and V_P to be equal to 1. In [5]: #Getting the determinant eq = mat.det()

Solving for E

eq = eq.subs(Vp, 1)eq = eq.subs(Vpp, 1)

len(Es) Out[6]: 3

In [6]: Es = solve(eq, E)

equation symbolically.

Since the equation was third order, we should get three different solutions of E. We can see from the output of the above cell, len(Es) is indeed 3. Let's see what these three solutions are: First Solution

Now, we need to solve for E in terms of E_0 , E_M and E_P . sympy has a function solve which solves the

E1 = Es[0]

Out[7]: $\frac{E_0}{3} + \frac{Em}{3} + \frac{Ep}{3}$

 $-3E_{0}Em - 3E_{0}Ep - 3EmEp + (-E_{0} - Em - Ep)^{2} + 9$ $-\frac{27E_{0}EmEp}{2} + \frac{27E_{0}}{2} + \frac{27Em}{2} + \frac{27Ep}{2}$ $-4(-3E_{0}Em - 3E_{0}Ep - 3EmEp + (-E_{0} - Em - Ep)^{2} + 9)^{3}$ $+ \frac{\sqrt{+(-27E_{0}EmEp + 27E_{0} + 27Em + 27Ep - (-9E_{0} - 9Em - 9Ep)(E_{0}Em + E_{0}Ep + EmEp - 3) + 2(-E_{0} - Em - Ep)^{3} - 54)^{2}}{2}$ $-\frac{2}{(-9E_{0} - 9Em - 9Ep)(E_{0}Em + E_{0}En + EmEn - 3)}$

Third Solution

Out[9]: $\frac{E_0}{2} + \frac{Em}{3} + \frac{Ep}{3}$

In [10]:

 $\sqrt{-\frac{(-9E_0-9Em-9Ep)(E_0Em+E_0Ep+EmEp-3)}{2}+(-E_0-Em-Ep)^3-27}$ $\left(-\frac{1}{2}+\frac{\sqrt{3}i}{2}\right)\begin{bmatrix} -\frac{27E_0EmEp}{2}+\frac{27E_0}{2}+\frac{27Em}{2}+\frac{27Ep}{2}\\ -4\left(-3E_0Em-3E_0Ep-3EmEp+(-E_0-Em-Ep)^2+9\right)^3\\ +\frac{\sqrt{(-27E_0EmEp+27E_0+27Em+27Ep-(-9E_0-9Em-9Ep)(E_0Em+E_0Ep+EmEp-3)+2(-E_0-Em-Ep)}}{2} \\ +\frac{(-27E_0EmEp+27E_0+27Em+27Ep-(-9E_0-9Em-9Ep)(E_0Em+E_0Ep+EmEp-3)+2(-E_0-Em-Ep)}{2} \\ +\frac{(-27E_0EmEp+27E_0+27Em+27Ep-(-9E_0-9Em-9Ep)(E_0Em+E_0Ep+EmEp-3)+2(-E_0-Em-Ep-Ep-Em-Ep-Em-Ep-Em-Ep-Ep-Em-Ep$ $rac{{{{\left({ - 9E_0 - 9Em - 9Ep}
ight)}{{\left({E_0 Em + E_0 Ep + Em Ep - 3}
ight)}}}}{2} + {{{\left({ - E_0 - Em - Ep}
ight)}^3} - 27}$

Plotting the Energy Curves

def substitute(E, K, **kwargs):

simplifying expressions, so it is giving us a huge expression.

all the substitutions and for a specific K value.

#Finally, we'll vectorize the function to run it faster

#K = K - 2*pi. Again, we'll be Using a=1 for simplicity E_num = E_num.subs(Em, give_energy(K=K-2*np.pi, **kwargs))

#So, we are removing the imaginary part using the line below

#Substituing E0 E_num = E.subs(E0, give_energy(K=K, **kwargs)) $\#Substituing\ Ep\ which is nothing but\ E0\ with\ K=\ K+\ G\ and\ as\ G=\ 2*pi,\ so$ #K = K + 2*pi/a. We'll be Using a=1 for simplicity E_num = E_num.subs(Ep, give_energy(K=K+2*np.pi, **kwargs)) $\#Substituing \ Em \ which is nothing but E0 with K= K-G \ and as G=2*pi, so$

Takes the symbolical value of E and returns numerical value of E after making

#Sometimes, we are getting a complex number, with very small imaginary part, #order of magnitute about 1e-15 because of the precision of the computer.

The solutions are still quite big and complex. The reason behind this is that sympy is not very good at

Final step is evaluating the energy of the system by substituting the values of E_P , E_M and E_0 into the equation. We already have a function give_energy that returns the energy E, given k, m and a. By default, $m=\hbar=1$. We'll use this defualt values. However, we can easily pass m and h (which is the placeholder for \hbar) as arguments to the function in place of **kwargs to change the default values.

In [11]: print(float(substitute(E1, 0.5))) print(float(substitute(E2, 0.5))) print(float(substitute(E3, 0.5))) print(float(substitute(E1, np.pi)))

 $E_num = E_num.evalf()$

return E_num

Let's do a sanity check!

 $E_num = E_num.subs(I, 0)$

substitute = np.vectorize(substitute)

print(float(substitute(E2, np.pi))) print(float(substitute(E3, np.pi)))

0.026544447872931975 16.60906075547166 23.217812401012836 3.9348022005446843 5.88289503360872 44.46512697183807

So, it is working. Let's plot them.

#Defining K values

#Setting Figure Size

plt.figure(figsize=(10,8))

#Plotting the three energies

#and two for x=pi, and x=-pi

plt.plot(K, Ev1, 'r', label='\$E_1\$') plt.plot(K, Ev2, 'g', label='\$E_2\$') plt.plot(K, Ev3, 'b', label='\$E_3\$')

#Making three vertical lines, one for x=0, ie. y-axis

In [12]:

In [13]:
